Nicolas Macias

PQArray Documentation 🤪

`PQArray();`
- Creates a PQArray. No parameters needed.

`void insert(Recipient recipient);`
- Inserts a Recipient object into PQArray. Automatically heapifys.

`Recipient extractValid(Donor donor);`
- Extracts a first valid match between donor and recipient in PQArray. It also returns the matched recipient found. If no match is found, then it returns a dummy recipient in which all internal info is either "INVALID" or -1. (Return type was mainly used for testing but I can see how it can be a nuisance in a full working version, if you'd like me to change it to something else lmk).
